CONGRATULATIONS  
VIVID LANDSCAPE & LIGHTING

## PROJECT DESCRIPTION

After the lighting consultation with VIVID's client, VIVID discussed lighting up the homeowners recent remodeled home to accent and showcase all of the best architectural features their beautiful home has that was hidden at night. The location of this project is on the Eastside of Evansville and is on a highly trafficked street with a lot of dark areas around each home. VIVID's immediate thought was to illuminate the dark areas around the home where darkness is secluded by tree coverage. With this lighting design, VIVID wanted to take it a step further and go above and beyond with their design by highlighting all of the soffit line around the whole front side of the home.

Outdoor landscape lighting is something VIVID has noticed that no one around Evansville is doing because they don't have the fixtures to accent the soffit the proper way. Using S1 Halos on a swivel by Garden Light, lighting designers at VIVID were able to attach the fixtures to the soffit where it meets the gutter then angle it towards the center of the peak. This works perfectly because each fixture placed has a certain beam degree to have the ability to spread the perfect amount of light across the soffit line. Next, VIVID wanted to accent the second story dormers to give a three-dimensional effect at night, this is accomplished by attaching S1 Halos to the roof on a swivel diagonally placed about 8-10 inches off the corner of the dormer siding.

As for the front foundation lighting, S1's were used on a stake with 25 degree beam angles to wash up the brick face between the windows so there is no glare shining through the window. The front porch entrance is accompanied by S1 12 degree beams shining up the columns then S1 Halos shining down the door frame on both sides. The lights are installed this way so the client did not have to turn on their front porch lights and to have the front entrance the main focal point when looking at the house.

In VIVID's lighting design, they always light up the key trees to show off the beauty and to really give a dramatic effect on the landscape. Three V2 were spaced accordingly around the base of the tree to provide the best even spread of light throughout the whole tree. As for safety, evenly placed were 5 P12 Pathway lights from the front door along the sidewalk to the mailbox down the driveway to illuminate the driveway landscape beds and the steps running up to the entrance. Lastly, VIVID aimed to tie in the garage as part of the house lighting. To accomplish this: VIVID placed S1 Halos shining down each brick face between the garage doors.

The main goal on lighting this house was to spread even light to showcase all the home's best features, but not have too much light that would create hot spots or wash out the color of the brick. Besides placing S1's to light up the house from the ground, the main locations of light were placed to showcase the soffit lines, front door entrance, dogwood tree and the down lights on the garage to get that even flow of light across the whole front facade of the home. VIVID really made this design stand out by using unique custom American made fixtures from partners at Garden Light LED.
